

"Numerical Analysis"

المسألة الأولى
- A. -

1 - Why use Numerical methods??

- ① To solve mathematical problems that cannot be solved exactly
- ② To solve engineering problems by digital computers.
- ③ For "Real-Time" engineering Computing.

2 - Steps in solving an engineering problem by numerical methods.

- ① problem definition
- ② mathematical model
- ③ choice of numerical method
- ④ programming and operation
- ⑤ interpretation of results

3 - * Accuracy: How close is a computed or measured value to the true value.

* Precision: How close a computed or measured value to previously computed or measured values.

* Inaccuracy: Asystematic deviation from the actual value

* Imprecision: Magnitude of scatter.

4 - Sources of Error

- ① Round off error
- ② Truncation error
- ③ Experimental
- ④ Programming

* Round off error (له علاقة بالجزء الذي تقبله الحاسب)

- ① Caused by representing a number approximately by significant number of digits
- ② Computation always done with fixed significant digits.

* There are Two type Methods

chopping and Rounding

التقطع (قطع الكسر) بغير النظر
عن باقي الجزء المقطوع

$$\pi = 3.14159265$$

$$\text{chopping} = 3.141592$$

عند التقطيع يجب مراعاة
الجزء المراد قطع

$$\pi = 3.14159265$$

$$\text{Rounding} = 3.141593$$

* Truncation error تعريب

Error caused by truncating or approximating
a mathematical procedure.

تعريب البيانات الحسابية التي تستخدمها الحاسب

Why measure error?

- ① To determine the accuracy of numerical results.
- ② To develop stopping criteria for iterative algorithm

❖ True Error : the difference between the true value in a calculation and the approximate value found using a numerical method.

$$\text{True Error} = \text{True Value} - \text{Approximate Value}$$

* Relative True Error

the ratio between the true error and the true value.

* Relative Approximate Error

the ratio between the approximate error and the present approximation

5 - What is Root?

In engineering it is frequently have to find
Solution of equations in the form

$$f(x) = 0$$

ex $x^2 - 3x + 2 = 0 \Rightarrow x = 1, 2$

* There are many Methods to find Roots of equation:

① Newton's Raphsan Method

$$x_{i+1} = x_i - \frac{f(x_i)}{f'(x_i)}$$

x_i = القيمة الحالية (التي)

x_{i+1} = القيمة الجديدة

② Secand Method

$$x_{i+1} = x_i - \frac{f(x_i)(x_i - x_{i-1})}{f(x_i) - f(x_{i-1})}$$

③ Bisection Method

* في هذه الطريقة نعلم قيمتان x

x_{lower} and x_{upper}

$$x_m = \frac{x_l + x_u}{2}$$

* نستخرج x_m الجديدة من التانون

لتحليل الحد فالك ثلاث طرق ماذا كانت :

① $f(x_l) f(x_m) < 0$ معينة سالبة

$$x_u = x_m, \quad x_l = x_l$$

② $f(x_l) f(x_m) > 0$ معينة موجبة

$$x_l = x_m, \quad x_u = x_u$$

③ $f(x_l) f(x_m) = 0$

$$x_m = \text{root}$$

وهو الجذر المطلوب

Taylor Series

$$* f(x_{i+1}) = f(x_i) + f'(x_i)h + \frac{f''(x_i)}{2}h^2 + \frac{f'''(x_i)}{3!}h^3 + \dots \quad \textcircled{1}$$

$$* f(x_{i-1}) = f(x_i) - f'(x_i)h + \frac{f''(x_i)}{2!}h^2 - \frac{f'''(x_i)}{3!}h^3 + \dots$$

$$* f(x_{i+1}) = f(x_{i-1}) + 2f'(x_i)h + \frac{2f''(x_i)}{3!}h^2 + \dots$$

$$* f'(x_i) = \frac{f(x_{i+1}) - f(x_i)}{h} \quad \text{forward}$$

$$* f'(x_i) = \frac{f(x_i) - f(x_{i-1}))}{h} \quad \text{backward}$$

$$* f'(x_i) = \frac{f(x_{i+1}) - f(x_{i-1}))}{2h} \quad \text{centered}$$

$$* \epsilon = \frac{\text{exact} - \text{error}}{\text{exact}} *$$

Example :- for Bisection Method

$$f(x) = x^3 - 5x + 1$$

$$x_L = 0$$

$$x_U = 1$$

$$\textcircled{1} x_m = \frac{x_L + x_U}{2} = \frac{0+1}{2} = 0.5$$

$$f(x_L) = 0 - 0 + 1 = 1$$

$$f(x_U) = 1 - 5 + 1 = -3$$

$$f(x_m) = (0.5)^3 - 5(0.5) + 1 = -1.375$$

$$f(x_L) \cdot f(x_m) < 0$$

$$1 \cdot -1.375 = -1.375 < 0$$

$$\therefore x_L = x_L, x_U = x_m$$

$$\textcircled{2} x_m = \frac{0.5+0}{2} = 0.25$$

$$f(x_L) = 1$$

$$f(x_m) = (0.25)^3 - 5(0.25) + 1$$

$$= -0.2343$$

$$f(x_L) \cdot f(x_m) = -0.2343 < 0$$

$$\therefore x_U = x_m \text{ \& } x_L = x_L$$

$$x_U = 0.25, x_L = 0$$

$$\textcircled{3} x_m = \frac{0.25+0}{2} = 0.125$$

$$f(x_m) = (0.125)^3 - 5(0.125) + 1$$

$$= 0.3769$$

	x_L	x_U	x_m	$f(x_L)$	$f(x_U)$	$f(x_m)$
$\textcircled{1}$	0	1	0.5	1	-3	-1.375
$\textcircled{2}$	0	0.5	0.25	1	-1.375	-0.2343
$\textcircled{3}$	0	0.25	0.125	1	-0.2343	0.3769
$\textcircled{4}$	0.125	0.25	0.1875	0.3769	-0.2343	0.0691
$\textcircled{5}$	0.1875	0.25	0.21875	0.0691	-0.2343	0.0260

$$\textcircled{4} f(x_L) \cdot f(x_m) = 0.3769 > 0$$

$$\therefore x_L = x_m = 0.125$$

$$x_U = 0.25$$

$$f(x_m) = (0.1875)^3 - 5(0.1875) + 1$$

$$= 0.0691$$

$$f(x_L) = (0.125)^3 - 5(0.125) + 1$$

$$= 0.3769$$

$$f(x_L) \cdot f(x_m) = 0.0260 > 0$$

$$\therefore x_U = x_m, x_L = x_L$$

$$\textcircled{5} x_m = \frac{0.1875 + 0.25}{2}$$

Secant Method

$$f(x) = \cos x - x$$

$$f(x) = x - \cos x$$

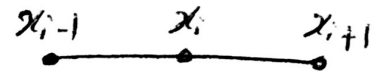

$$x_{i-1} = 0.5$$

$$x_i = 1$$

$$f(x) = x - \cos x \Rightarrow f(x_i) = 1 - \cos 1 = 0.45969$$

$$f(x_{i-1}) = -\cos 0.5 + 0.5 = -0.37758$$

$$x_{i+1} = x_i - \frac{f(x_i) \cdot (x_i - x_{i-1})}{f(x_i) - f(x_{i-1})}$$

$$= 1 - \frac{0.45969 \times (1 - 0.5)}{0.45969 - (-0.37758)} = 0.72548$$

$$x_{i+1} = 0.72548 - \frac{f(x_i) \cdot (x_i - x_{i-1})}{f(x_i) - f(x_{i-1})}$$

$$x_{i+1} = 0.72548 - \frac{[-0.02270 \times -0.27452]}{[-0.02270 - 0.45969]}$$

x_i	x_{i-1}	x_{i+1}	$f(x_i)$	$f(x_{i-1})$	ϵ
1	0.5	0.72548	0.45969	-0.37758	
0.72548	1	0.73839	-0.02270	0.45969	0.1
0.73839	0.72548	0.73778	-0.00116	-0.02270	
0.73778	0.73839	0.738173	-0.00221	-0.00116
